Linear Algebra Tutorial3

2023.10.24

homework

- please notice that the ddl is 22:00!
- please notice which homework you are handing in

homework

iff: if and only if
 which means you need to prove both if "⇐" and only if "⇒"
 Or always uses ⇔

Problem E(6 Points). (2021年线性代数期中考试题)

A square matrix A is called idempotent if $A^2 = A$.

A square matrix A is called involutory if $A^2 = I$ (I is the identity matrix).

- 1. (2 points) Suppose that A, B are both idempotent. Prove that A+B is idempotent if and only if AB+BA=0. (if and only if: 当且仅当)
- 2. (3 Points) Suppose that A, B are both involutory. Prove that AB is involutory if and only if AB = BA.

• we are mainly talking about the determinant these times, so without announcement, all the matrixes are square matrixes

Diagonal matrices

- ullet for diagonal matrix D, $D_{ij}=0$ for i
 eq j so it can be written as $D=diag(d_1,d_2,\cdots,d_n)$
- the power of diagonal matrix is easy to compute $D^k=diag(d_1^k,d_2^k,\cdots,d_n^k)$ \rightarrow similarity and diagonalizable(much later)
- ullet the diagonal matrix D is invertible if and only if $orall i, d_i
 eq 0$

$$|D|=\Pi d_i$$

triangular matrix

upper triangular matrix
 the elements below the diagonal are all zero
 (the elements on the diagonal can be zero or not)

$$A = egin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \ 0 & a_{22} & \cdots & a_{2n} \ dots & dots & \ddots & dots \ 0 & 0 & \cdots & a_{nn} \end{bmatrix}$$
 ,

then elements on the diagonal of A^k are $a_{11}^k, a_{22}^k, \cdots, a_{nn}^k$

- hint: try to prove it by induction
- similar to the lower triangular matrix

symmetric matrix

 \bullet $A^T = A$

all properties of symmetric matrix are based on this definition(this time) (more propertires later such as similarity and diagonalizable)

• $\forall A_{m \times n}, AA^T$ or A^TA are symmetric matrix

- a function mapping a matrix A into a scalar det(A) or |A| $A^{-1} = \frac{1}{|A|}A^*$
- the most simple usage: invertibility

minor and cofactor

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{bmatrix} \quad \tilde{A}^{ij} = \begin{bmatrix} a_{11} & \dots & a_{1j} & \dots & a_{1n} \\ \vdots & \vdots & & \vdots & \vdots \\ a_{i1} & \dots & a_{ij} & \dots & a_{in} \\ \vdots & \vdots & & \vdots & \vdots \\ a_{n1} & \dots & a_{nj} & \dots & a_{nn} \end{bmatrix}$$

- minor: 余子式
- cofactor: 代数余子式
- $egin{aligned} M_{ij} &= det(ilde{A}_{ij}) \ & C_{ij} = (-1)^{i+j} M_{ij} \end{aligned}$
- cofactor expansion along the i-th row

$$det(A) = \sum\limits_{j=1}^{n} a_{ij} C_{ij}$$

similarly, we can expand along the j-th column

determinant example

$$A = \begin{bmatrix} 1 & 0 & 0 & -1 \\ 3 & 1 & 2 & 2 \\ 1 & 0 & -2 & 1 \\ 2 & 0 & 0 & 1 \end{bmatrix}$$

- expand along the row?
- expand along the column?

we can pick any row or column to expand, so just make it as easy as possible

trangular matrix determinant

$$A = egin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \ 0 & a_{22} & \cdots & a_{2n} \ dots & dots & \ddots & dots \ 0 & 0 & \cdots & a_{nn} \end{bmatrix}$$

$$ullet \ det(A) = \prod_{i=1}^n a_{ii}$$

and the lower triangular matrix is the same

determinant properties

compare with the elementary row(column) operations

- 1. B is obtained from A by interchanging two rows(columns) $\left|B\right|=-\left|A\right|$
- 2. B is obtained from A by multiplying one row(column) by a nonzero scalar k $\left|B\right|=k|A|$
- 3. B is obtained from A by adding a multiple of one row(column) to another row(column)

$$|B| = |A|$$

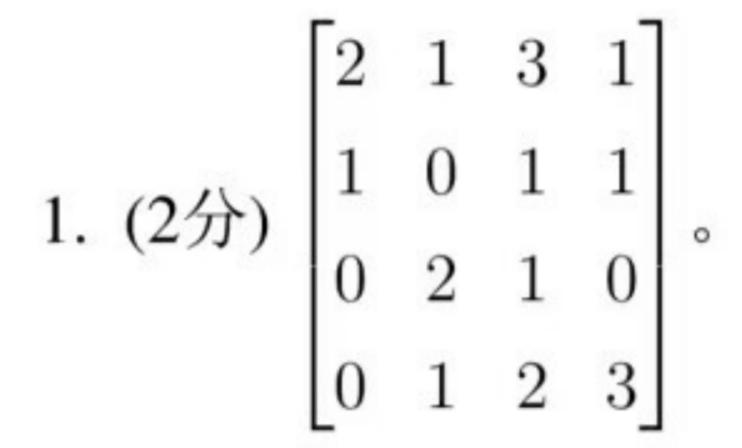

we can mix row and column operations when calculating the determinant but we can only use row or column operations when calculating the inverse matrix!!!!

determinant properties

$$|A^T| = |A|$$
 $\lambda A = \lambda^n |A|$
 $|AB| = |A||B|$
 $|A^{-1}| = \frac{1}{|A|}$

example

calculate the determinant of the following matrix

Vandermonde determinant

$$V = egin{bmatrix} 1 & x_1 & x_1^2 & \cdots & x_1^{n-1} \ 1 & x_2 & x_2^2 & \cdots & x_2^{n-1} \ dots & dots & dots & dots \ 1 & x_n & x_n^2 & \cdots & x_n^{n-1} \end{bmatrix}$$

$$ullet \ det(V) = \prod_{1 \leq i < j \leq n} (x_j - x_i)$$

proof: induction

ullet verify n=3

https://blog.csdn.net/u011089523/article/details/72845136

 $\begin{vmatrix} bc & 1 & a \\ ac & 1 & b \\ ab & 1 & c \end{vmatrix}$

$$\begin{vmatrix} bc & 1 & a \\ ac & 1 & b \\ ab & 1 & c \end{vmatrix}$$

$$D=egin{bmatrix} a_1 & c_2 & c_3 & \cdots & c_n \ b_2 & a_2 & & & & \ b_3 & & a_3 & & & \ dots & & \ddots & & \ b_n & & & a_n \end{bmatrix}$$

$$det(D) = \prod_{i=1}^n a_i - \sum_{i=2}^n rac{Ab_n c_n}{a_n}$$
 where $A = \prod_{i=2}^n a_i$

$$D = egin{bmatrix} a & b & 0 & \cdots & 0 & 0 \ 0 & a & b & \cdots & 0 & 0 \ dots & & & dots \ 0 & 0 & 0 & \cdots & a & b \ b & 0 & 0 & \cdots & 0 & a \end{bmatrix} \ |D| = a^n + (-1)^{1+n}b^n$$

$$|D| = a^n + (-1)^{1+n}b^n$$

$$D_n = egin{bmatrix} b & -1 & 0 & \cdots & 0 & 0 \ 0 & b & -1 & \cdots & 0 & 0 \ dots & & & dots \ 0 & 0 & 0 & \cdots & b & -1 \ a_n & a_{n-1} & a_{n-2} & \cdots & a_2 & b+a_1 \end{bmatrix} \ egin{bmatrix} |D_n| = b \cdot |D_{n-1}| + a_n (-1)^{n+1} (-1)^{n-1} \ |D_n| = b \cdot |D_{n-1}| + a_n \end{aligned}$$

Calculate
$$D_{n} = \begin{vmatrix} 1 + x_{1}^{2} & x_{1}x_{2} & \cdots & x_{1}x_{n} \\ x_{2}x_{1} & 1 + x_{2}^{2} & \cdots & x_{2}x_{n} \\ \vdots & \vdots & \ddots & \vdots \\ x_{n}x_{1} & x_{n}x_{2} & \cdots & 1 + x_{n}^{2} \end{vmatrix}.$$

$$A = egin{bmatrix} 1 & 1 & 5 & 4 \ 2 & 3 & 2 & 4 \ 1 & 6 & 0 & 3 \ 4 & 2 & 5 & 1 \end{bmatrix}$$

find $C_{21}+C_{22}+5C_{23}+4C_{24}$

where C_{ij} is the cofactor of a_{ij}

$$A = egin{bmatrix} 1 & 1 & 5 & 4 \ 2 & 3 & 2 & 4 \ 1 & 6 & 0 & 3 \ 4 & 2 & 5 & 1 \end{bmatrix}$$

construct:

$$A' = egin{bmatrix} 1 & 1 & 5 & 4 \ 1 & 1 & 5 & 4 \ 1 & 6 & 0 & 3 \ 4 & 2 & 5 & 1 \end{bmatrix}$$

so
$$C_{21}+C_{22}+5C_{23}+4C_{24}=|A'|$$
 and since A' has two same rows, $|A'|=0$ so $C_{21}+C_{22}+5C_{23}+4C_{24}=0$
